mutation(s)
Sizolosure; Fig 11; 73pp; English
This is the amino acid sequence of the multiple tumour suppressor
This is the amino acid sequence of the invention. The MTS gene
(MTSIELS) protein, used in the method of the invention. The MTS gene
is useful in the diagnosis and prognosis of human cancer, e.g. by
strandard nucleic hybridisation techniques, of patient samples. The
mutated sequences are those that are present in somatic mutations
of the gene in cancers. The vectors can be used for gene therapy
strategies to replace function of mutated protein in patients. These
can also be used to construct protein mimetics, also for therapeutic
strategies. In addition the expression constructs can also be used
for recombinant production of MTS. Recombinant MTS can be used to
screen for drugs to be used for cancer therapy, and the protein
itself may also be used to restore MTS function in a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             60 VAELLILHGAEPNCADPATLTRPVHDAAREGFLDTLVVLHRAGARLDVRDAWGRLPVDLA 119
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence resents a human multiple tumour suppressor 2 (MTS2) protein. The sequence is homologous to the corresponding murine gene. Primers designed from the gene can be used to design primers to detect abnormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, lymphoma, glioma, as well as tumours of e.g. the breast, thyroid, pancreas, uterus and kidneys.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           VAELLLIHGAEPNCADPATLITRPVHDAAREGFLDTLVVLHRAGARLDVRDAWGRLPVDLA 120

production of recombinant mutant polypeptide(s)
Disclosure; Columns 73-74; 72pp; English.
The present sequence the human multiple tumour suppressor
(MTS2) gene product, useful in cancer diagnosis.
Sequence 138 AA;

DNA specific for Multiple Tumour Suppressor IE1-beta gene - are useful for the diagnosis of cancers related to MTSIE1-beta mutation(s) and their treatment mutation(s) and their treatment bisclosure; Fig il; 72pp; English.

This sequence represents a human multiple tumour suppression protein, mTS2. The MTS gene locus is also referred to as the familial melanoma (MLM) genes can be used in the diagnosime 9p21. Germ line mutations in MTS genes can be used in the diagnosis of predisposition to cancers, e.g. melanoma, leukaemla, astrocytoma, gliboblastoma, lymphoma, GLL, and cancers of the pancreas, breast, thyroid, sequence 138 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cell-cycle regulatory protein p15.

NP-PSDB; 75-75-75-75.

New cell cycle regulating proteins bind to cyclin dependent kinase and related nucleic acids, antibodies etc., used in diagnosis and therapy of abnormal cell proliferation, degeneration etc.

Claim B; Page 78: 109pp; English.

The human cell-cycle regulatory (CCR) protein p15 (R85117) was obtd. by expression of a cDNA clone (T02963) isolated from transforming growth factor-stimulated HeCaT cells. CCR p15 specifically inhibits the activity of cyclin-dependent kinases during various stages of the cell cycle, and can be used in the treatment and diagnosis of proliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1 MREENKGMPSGGGSDEGLASAARGLVEKVRQLLEAGADPNGVNRFGRRAIQVMMGSAR

Claim 9; Page 81-82; 109pp; English.
The mouse cell-cycle regulatory (CCR) protein p15 (R85118) was obtd. by expression of a CDNA clone (T02964) isolated from mouse embryonal carcinoma cells. CCR p15 specifically inhibits th activity of cyclin-dependent kinases during various stages of the cell cycle, and can be used in the treatment and diagnosis of proliferative disorders.

Expression construct contg. DNA for tumour suppressor p16 - to restore p16 activity to transformed cells, useful for treating lung or bladder cancer or melanoma Disclosure; Fig 1b; 92pp; English.

This sequence represents the tumour suppressor p16. The DNA encoding this sequence is joined to a promoter functional in eukaryotic cells and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tumour suppressor p16.

Tumour suppressor; p16; inhibitor; cyclin-dependent kinase 4; CDK4;

Cancer cell; lung cancer; bladder cancer; melanoma; restenosis; therapy;
anti-anglogenic activity; hyperproliferative disorder.

Homo saplens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a human multiple tumour suppressor I (MTS1) protein. The sequence is homologous to the corresponding murine gene. Primers designed from the gene can be used to design primers to detect abnormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, lymphoma, glioma, as well as tumours of e.g. the breast, thyroid, pancreas, uterus and kidneys.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         76 ATLITRPVHDAAREGFLDTLVVLHRAGARLDVRDAWGRLPVDLAEELGHRDVARYLRAAAG 135

                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents mouse multiple tumour suppressor (WTS2) gene. The MTS1 gene can be used to design primers to detect abnormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, imphoma, glioma, as well as tumours of e.g. the breast, thyroid, pancreas, uterus and kidneys.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          10-SEP-1997 (first entry)
Human multiple tumour suppressor 1 gene product.
Human; multiple; tumour; suppressor; MTS1; cancer; diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human mutant multiple tumour suppressor gene sequences - for production of recombinant mutant polypeptide(s) Claim 1; Columns 61-64; 72pp; English.
The present sequence the human multiple tumour suppressor 1 (MTS1) gene product, useful in cancer diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score 749; DB 1; Length 130;

This is the amino acid sequence of the multiple tumour suppressor 1

This is the amino acid sequence of the multiple tumour suppressor 1

(MTS-1) protein, used in the method of the invention. The MTS gene

(MTS-1) protein, used in the method of the invention. The WTS gene

(Standard nucleic hybridisation techniques, of patient samples.)

The MTS are present in somatic mutations of the gene in cancers. The vectors can be used for gene therapy strategies to replace function of mutated protein in patients. These can also be used to construct protein mineries, also for therapeutic strategies. In addition the expression constructs can also be used for recombinant production of MTS. Recombinant MTS can be used to screen for drugs to be used for cancer therapy, and the protein sequence 156 AA;
used in the expression construct of the invention. pl6 is an inhibitory actually, which is involved in the control of cyclin-dependent kinase 4 activity, and functions as a tumour suppressor. By detected whis sequence or the DNA encoding it, cancer cells can be detected. When the nucleic acid molecule is in the sense orientation, the expression construct can be used to restore pl6 function in a cell, particularly by reversing the transformed phenotype in tumours, especially lung or bladder cancer or melanoma. It may also have anti-angiogenic activity, and inhibit hyperproliferative disorders, e.g. restenosis. When the nucleic acid molecule is inscrted in the antisense orientation, the expression construct inhibits acid, may be diagnostic of tumours, e.g. by southern or Northern blot, antibody immunoblot, fluorescent cell sorting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      76 ATLTRPVHDAAREGFLDTLVVLHRAGARLDVRDAWGRLPVDLAEELGHRDVARYLRAAAG 135

MTS1; multiple tumour suppressor; diagnosis; cancer; germ-line mutation;
familial melanoma locus; MLM; predisposition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA specific for Multiple Tumour Suppressor IEI-beta gene - are useful for the diagnosis of cancers related to MTSIEI-beta mutation(s) and their treatment Disclosure; Column 63-64; 72pp; English.

This sequence represents a human multiple tumour suppression protein, MTSI. The MTS gene locus is also referred to as the familial melanoma (MLM) genes can be used in the diagnosis of predisposition to cancers, e.g. melanoma, leukementa, astrocytoma, gliboblastoma, lymphoma, gliona, Hodgkin's lymphoma, CLL, and cancers of the pancreas, breast, thyroid, ovary, uterus, testis, kidney, stomach and rectum.

Human erythrocyte ankyrin, a cytoskeleton component,
generates the p57 membrane proteinase which cleaves C3, the
third component of complement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               #authors Davis, L.H.; Bennett, V.

1 MREENKGMPSGGGGDEGLAT.....LAEERGHRDVAGYLRTATGD 137 Title: Description: Perfect Score: Sequence:

PAM 150 Gap 11 Scoring table:

83857 seqs, 30454973 residues Searched:

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

swiss-prot38 1:swissprot

Mean 43.541; Variance 77.735; scale 0.560 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Mutaine erythrocyte ankytin cDNA: highly conserved regions of the
regulatory domain.";
Mamm. Genome 3:281-285(1992).
-!- FUNCTION: ATTACH INTEGRAL MEMBRANE PROTEINS TO CYTOSKELETAL
ELEMENTS: BIND TO THE EXPHROCYTE MEMBRANE PROTEIN GP85, AND TO THE
CYTOSKELETAL PROTEINS FODENIN, TOBULIN, VIENTIN AND DESMIN.
ERYTHROCYTE ANKYRINS ALSO LINK SPECREIN (BETA CHAIN) TO THE
CYTOPLASMIC DOMAIN OF THE ERYTHROCYTES ANION EXCHANGE PROTEIN;
THEX PETAIN MOST OR ALL OF THESE BINDING FUNCTIONS.
-!- SUBCELLULAR LOCATION: CYTOPLASMIC SURFACE OF ERYTHROCYTIC
PLASMA MEMBRANE.

Submitted (JUN-1996) to the EMBL/GenBank/DDBJ databases.

-!- SUBCELLUTAR LOCATION: TYPE I MEMBRANE PROTEIN.

-!- DEVELOPMENTAL STRAGE: EXPRESSED ALMOST UNIFORMLY IN EARLY EMBRYOS.

-!- SIMILARITY: HIGH, WITH OTHER NOTCH-TYPE PROTEINS.

-!- SIMILARITY: CONTAINS 36 EGF-LIKE DOMAINS.

-!- SIMILARITY: CONTAINS 6 ANK REPEATS.

BAND 4.2, TO NA-K ATPASE, TO THE LYMPHOCYTE MEMBRANE PROTEIN GP85, AND TO THE CYTOSKELETAL PROTEINS FODRIN, TUBULIN, VIMENTIN AND DESMIN. ERYTHROCYTE ANKYRINS ALSO LINK SPECTRIN (BETA CHALN) TO THE CYTOPLASMIC DOMAIN OF THE REYTHROCYTES ANION EXCHANGE PROTEIN; THEY RETAIN MOST OR ALL OF THESE BINDING FUNCTIONS.

ALTERNATIVE PRODUCTS: THE TWO BRAIN VARIANTS ARE PRODUCED BY ALTERNATIVE SPLICITY: PLASAM MEMBRANE OF NEURONS AS WELL AS GLIAL CELLS THROUGHOUT THE BRAIN.

SIMILARITY: CONTAINS 24 ANK REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 131; DB 1; Length 1839;

Mean 42.547; Variance 77.508; scale 0.549 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
